

INTERNAL SOURCE-BACKED PREVIEW - NOT FOR EXTERNAL USE

# VULCA Solution Pack v1 page components

raw crops are internal only

Pages 7-12

2026-06-21

This preview turns the accepted storyboard into reviewable page components. It uses true source-backed crops to check composition, case-packet logic, callouts, and field language. Customer-facing export still requires redraw, masking, clearance, and the final safety gate.

# Product-truth and claim evidence

This lane turns campaign claims, product representation, award or collaboration language, and ecommerce reuse into a source-backed evidence queue.

## Production decision

PROYA leads with current source-backed material. Genki Forest stays reserve and should not compete with the lead packet.

2026 source priority

owner route visible

no negative finding

## PROYA lead: campaign-product display

Use as the redrawn queue hero after masking and source-safe annotation.

## Owner route

Claim cue to review question to evidence card to release owner.

public product/campaign surface

award or news source

brand / ecommerce owner

external redraw required

## Offline event cue

Secondary source-context chip; not a hero.

## Genki reserve

Small comparator from product-page context if Page 7 needs category width.

## Award/source cue

Use only as a public source cue, not as a performance claim.

## PDP / source record

Neutral redrawn record chip; no local filename in final PDF.

## Claim, source, representation, owner

The card asks what should be confirmed before reuse. It does not say the public example has a defect.

### Finding style

The claim, product visual, source material, approval owner, and reuse context should be connected before cross-channel use.

### Product-Truth evidence card

state: needs\_review

severity: 2

public source basis

#### CALLOUTS

- Campaign/source text cue
- Product representation / packshot area
- Public source record and capture date
- Channel reuse / owner route question

#### SUGGESTED ACTION

Attach source material, claim owner, channel variants, and release decision owner before reuse.

brand / ecommerce release owner

does not claim legal approval, rights ownership, compliance, customer relationship, or defect

# AI publishability and generated asset context

This lane turns prompt/reference context, model or tool context, output state, AI labeling posture, and export/share states into a reviewable publishability record.

## Production decision

Seedream / BytePlus is the lead packet. Kling is reserve for video/reference workflow context only.

## Model/version

Public source-page context; not a VULCA model-quality claim.

## Category context

Image-generation model list as source basis, not ranking evidence.

## Input mode

Tutorial/prompt source context for evidence-card requirements.

## Output context

Use as source-record basis for output state and format questions.

## Label / disclosure

Neutral chip asks whether AI labeling posture is visible or required.

## Kling reserve

Small video/reference comparator only; visually document-heavy for lead.

model/version page

tutorial workflow surface

product / platform owner

no model quality or safety claim

# Input, output, label, owner

Generated examples need visible input/reference context, output state, label posture, and human release ownership before gallery, demo, export, or campaign reuse.

## Boundary

No model quality, copyright-clearance, platform-policy, safety-certification, or customer-relationship claim.

## AI Publishability evidence card

- Label/disclosure and human owner route

## SUGGESTED ACTION

Provide prompt/result pairs, source references, label posture, export/share state, and release owner.

## DOES NOT CLAIM

Model quality, copyright clearance, platform approval, policy compliance, safety certification, or customer relationship.

## AI ad workflow and creative automation evidence

This lane turns ad generation, product-to-video workflows, creative scoring, shop flows, campaign reuse, and evidence handoff into a release queue.

### Production decision

Creatify leads because the product-link-to-video workflow gives the clearest commercial story.

Sample preview - not legal advice

## Workflow step, source, score, handoff

Ad-generation workflows need visible source inputs, scoring context, edit/export state, campaign reuse context, and human handoff ownership before a campaign decision.

### Closing role

This page closes the three-lane case group before the safety boundary and pilot CTA.

### AI Ad Workflow evidence card
